TASK 25 / 25

Principal / Certification · Principal

Sprint E - Hardening, Compliance & Go-Live · Mastery 100%

Focus

Certify the data layer for v2.0 and own the live launch measurement.

What to build / complete

- A certification: metric integrity, quality SLAs, compliance, recovery, unit economics
- A live launch dashboard with defined rollback triggers
- A post-launch readout and Phase-4 analytics roadmap

Execution — work through in order

Phase 3 gives you a goal and a bar, not a recipe. These stages are the discipline; the design decisions are yours to make and defend.

Stage A — Understand & set the bar

1. Re-read the Expected Output and the scoring parameters so you build to the bar, not past it.
2. Confirm every prerequisite and upstream input is actually in your hands, not merely promised.
3. Restate, in one sentence, what 'good' means here: The company launches v2.0 watching numbers it can trust, with a pre-agreed number that says 'roll back'.

Stage B — Build: A certification: metric integrity, quality SLAs, compliance, recovery, unit economics

1. Define the metric, its source & the decision

Define precisely what “A certification: metric integrity, quality SLAs, compliance, recovery, unit economics” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage C — Build: A live launch dashboard with defined rollback triggers

1. Define the metric, its source & the decision

Define precisely what “A live launch dashboard with defined rollback triggers” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage D — Build: A post-launch readout and Phase-4 analytics roadmap

1. Define the metric, its source & the decision

Define precisely what “A post-launch readout and Phase-4 analytics roadmap” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage E — Integrate, verify & make demoable

1. Wire your work into the end-to-end flow and run the whole journey once, start to finish.
2. Present the certification and run the live launch dashboard during the staged rollout.
3. Break it on purpose: force the failure path and confirm it degrades the way you designed.
4. Prepare a live demo on real data. Not slides, not screenshots, not 'it works on my machine'.

Done when (demoable by end of task)

- “A certification: metric integrity, quality SLAs, compliance, recovery, unit economics” is complete, real, and demoable end-to-end.
- “A live launch dashboard with defined rollback triggers” is complete, real, and demoable end-to-end.
- “A post-launch readout and Phase-4 analytics roadmap” is complete, real, and demoable end-to-end.
- Good looks like: The company launches v2.0 watching numbers it can trust, with a pre-agreed number that says 'roll back'.

Worry if any of these are true

- Launch with no pre-agreed rollback metric.
- Certification without data-quality or compliance evidence.
- Calling an experiment early because it looked good on day two.

Hand-off

- Certified data layer to production ownership. Make sure the next person can pick it up without you.
